

## **Internship at Startup Greece**

### **Introduction**

Congratulations! You have successfully made it through the 2nd stage of the application process, where we chose the applicants with the most suitable profile. For the next stage, you will need to complete the following demo task in order for us to evaluate your suitability for the Software Developer position at Startup Greece.

## TASK 1

- Create a custom build form – the user can add or remove fields at will. (The fields to be added or deleted have to be of just 2 types – text & select)
- When the user saves the data from the form, all the data has to be displayed in a table. The table will have at the header the name of each field, for example First name, and in the first row the answers of the form submitted, for example Dimitris.
- Upload the code on Github.
- Send me the link of the repository.

### Notes:

- There can be back-end and front-end implementations .
- Put the form and the table on the same page - no need to spend time super designing them, we care about the main functionality.
- You should use only JavaScript and jQuery – you are not allowed to use React or Angular or any other JS framework.
- You can use other JavaScript & jQuery libraries that may help you.

—

Tasks will be evaluated according to:

- Information gathering capabilities and suitability of data,
- Language style and structure of the text,
- Understanding of tasks.

Good luck and thank you very much for all your effort!
